

# Quiz: Functional Dependency & Normalization Solutions

---

## [Part A: Functional Dependency Quiz]

1. \_\_\_\_\_ refers to an attribute or group of attributes mentioned in the *left-hand side* of the arrow in a Functional Dependency (FD).

- a) Discriminator
- b) Determinant
- c) Multivalued attribute
- d) All of the above

Solution: **Determinant.**

2. In a functional dependency  $X \twoheadrightarrow Y$ , if Y is functionally dependent on X, but not on X's proper subsets, then we would call the functional dependency as:

- a) Full Functional Dependency
- b) Partial Functional Dependency
- c) Multivalued Functional Dependency
- d) None of the above

Solution: **Full Functional Dependency. Example: {SSN, PID}  $\rightarrow$  Hours. The 'Hours' is only *fully dependent* on *both* 'SSN' and 'PID' (project ID) attributes.**

3. Which of the following is the result of bad database design?

- a) Repetition of Information
- b) Inability to represent some information
- c) Inconsistent database state due to some transaction
- d) All of the above

Solution: **All of the above**

4. If  $X \twoheadrightarrow \{Y, Z\}$  then  $X \twoheadrightarrow Y$  and  $X \twoheadrightarrow Z$  is

- a) Composition Rule
- b) Reflexivity Rule
- c) Union Rule
- d) Decomposition Rule

Solution: **Decomposition Rule. Example:  $SSN \twoheadrightarrow \{Name, Salary\}$  then  $SSN \twoheadrightarrow Name$  and  $SSN \twoheadrightarrow Salary$**

5. If  $X \twoheadrightarrow Y$  is a functional dependency and X and Y are sets of attributes, what is the relationship between X and Y?

- a) One-to-Many
- b) Many-to-One
- c) One-to-One
- d) Many-to-Many

Solution: **One-to-One**

6. For a functional dependency  $X \twoheadrightarrow Y$ , it is said to be \_\_\_\_\_ if  $Y$  is the subset or equal to  $X$ .

- a) Total
- b) Trivial
- c) Non-trivial
- d) Partial

Solution: **Trivial. Example:**  $\{SSN, Name\} \rightarrow SSN$  and  $\{SSN, Name\} \rightarrow \{SSN, Name\}$  are both *trivial* FDs.

7. Which of the following functional dependencies are held in the given table?

RegNo	Name	Gen	Edu	Phone	Manager
R1	Sundar	M	BTech	9898786756	Kumar
R2	Ram	M	MS	9897786776	Kumar
R3	Karthik	M	MCA	8798987867	Steve
R4	John	M	BSc	7898886756	Badrinath
R5	Priya	F	MS	9809780967	Kumar
R6	Ram	M	MTech	9876887909	Jagdeesh

- a)  $RegNo \twoheadrightarrow \{Name, Gen, Edu\}$
- b)  $RegNo \twoheadrightarrow \{Phone\}$
- c)  $\{Manager, Name\} \twoheadrightarrow RegNo$
- d) All of the above

Solution: **All of the above. All FDs hold true.**

8. Consider the FDs:  $RegNo \twoheadrightarrow \{Name, Gen, Edu, Phone, Manager\}$ ,  $Phone \twoheadrightarrow \{RegNo, Name, Gen, Edu, Manager\}$  and  $Edu \twoheadrightarrow Manager$ . If these are the functional dependencies of the given relation, which of the following is the Primary key? (it may be more than one option)

- a) RegNo
- b) Phone
- c)  $\{RegNo, Phone\}$
- d)  $\{RegNo, Edu\}$

Solution: **RegNo or Phone; both options are correct. (c) is incorrect, since it is not the minimum super key (it consists of two candidate keys), while (d) it is just a superkey.**

9. Let the relation  $R(A, B, C, D, E)$ . If  $\{A, B\}$ ,  $\{A, B, E\}$ , and  $\{C, D, E\}$  can uniquely identify any tuple in the relation, which of the following would be the Primary key?

- a) ABE
- b) CDE
- c) AB
- d) None of the above

Solution: **The minimum super key, i.e., the set with the minimum number of attributes that can uniquely identify any tuples in R is the set  $\{AB\}$ .**

10. Consider the relation  $R(B, O, I, S, Q, D)$ . If  $S \twoheadrightarrow D$ ,  $I \twoheadrightarrow B$ ,  $\{IS\} \twoheadrightarrow Q$ , and  $B \twoheadrightarrow O$ , then which is the candidate key?

- a) IS
- b) IB
- c) BO
- d) SD

Solution: **The set {IS} can determine all the other attributes. I determines B, and via transitivity of  $B \rightarrow O$ , I determines both {B, O}. S determines D and both {IS} determine Q. Hence, {IS} determine {Q, D}. That is, IS can determine B, O (from I), D (from S), Q (from IS), i.e.,  $IS \rightarrow \{B, O, D, Q\}$ .**

11. If  $A \twoheadrightarrow B$ ,  $B \twoheadrightarrow C$ , and  $C \twoheadrightarrow D$ , then which of the following is true?

- a)  $A \twoheadrightarrow C$
- b)  $B \twoheadrightarrow D$
- c)  $A \twoheadrightarrow D$
- d) All of the above

Solution: **All of the above. (a)  $A \rightarrow B$  via transitivity ( $A \rightarrow B, B \rightarrow C$ ), (b)  $B \rightarrow D$  via transitivity ( $B \rightarrow C, C \rightarrow D$ ), and (c)  $A \rightarrow D$  via all the above:  $A \rightarrow B, B \rightarrow C, C \rightarrow D$ .**

12. Which of the following in a relation schema R *fully* functionally determines *all* the attributes of R?

- a) Primary Key
- b) Candidate Key
- c) Both Primary and Candidate Key
- d) Neither Primary Key nor Candidate Key

Solution: **Both Primary and Candidate Key.**

13. Let the candidate keys for the relation  $R(A,B,C,D,E)$  be  $\{A,B\}$ ,  $\{A,C\}$ ,  $\{C,D\}$ , and assume that  $\{A,B\}$  is chosen as the Primary key for R. Which of the following is true?

- a) A is non-prime attribute
- b) C is a prime attribute
- c) E is prime attribute
- d) None of the above

Solution: **C is a prime attribute.**

14. Assume that a **Bank** associates every **Customer** with the home **Branch**, in which the customer maintains an account. Which of the following is true?

- a)  $\text{Branch} \twoheadrightarrow \text{Branch}$
- b)  $\text{Customer} \twoheadrightarrow \text{Branch}$
- c)  $\text{Customer} \twoheadrightarrow \text{Customer}$
- d) All of the above

Solution: **All of the above**

15. In a relational schema  $R(A, B, C)$  with functional dependencies  $A \twoheadrightarrow B$ ,  $B \twoheadrightarrow C$ , and  $A \twoheadrightarrow C$ , which of the functional dependencies is redundant?

- a)  $A \twoheadrightarrow C$
- b)  $A \twoheadrightarrow B$
- c)  $B \twoheadrightarrow C$
- d) None of the above

Solution:  **$A \rightarrow C$ , since this can be inferred by the transitivity:  $A \rightarrow B$  and  $B \rightarrow C$ .**

**[Part B: Normal Forms Quiz]**

1. Assume that a relation R has the following properties. What is the normal form of R?

**Properties:** *No multi-valued attributes, no partial functional dependencies with the primary key.*

- a) First Normal Form
- b) Second Normal Form**
- c) Third Normal Form
- d) Boyce-Codd Normal Form

2. Assume that a relation R has the following properties. What is the normal form of R?

**Properties:** *Has no partial functional dependencies, has multi-valued attributes*

- (a) First Normal Form
- (b) Second Normal Form
- (c) Third Normal Form
- (d) None of the above**

3. Assume that a relation R has the following properties. What is the normal form of R?

**Properties:** *Has no multi-valued attributes, has no partial functional dependencies, has attributes with atomic domains, has transitive dependencies.*

- (a) 1NF & 2NF**
- (b) 1NF, 2NF, & 3NF
- (c) 1NF & 3NF
- (d) BCNF

4. Consider a relation R with the following functional dependencies:

$\{A \rightarrow B, C \rightarrow D, AC \rightarrow E, D \rightarrow F\}$ .

How many keys does R have and what are they?

- (a) 1, {(AC)}**
- (b) 2, {(AC), (AD)}
- (c) 3, {(AC), (BC), (ABD)}
- (d) 2, {(AC), (ABD)}

5. Consider the relation below. Select one of the following FDs that would violate the 3NF property?

**Student (StudentID, StudentName, StudentPhone, CourseID, CourseName)**

- (a)  $\text{StudentID} \rightarrow \text{StudentName}$
- (b) CourseID  $\rightarrow$  CourseName**
- (c)  $\text{StudentID} \rightarrow \text{StudentPhone}$
- (d)  $\text{StudentID} \rightarrow \text{CourseID}$

**Explanation:** The CourseID causes a transitive FD between CourseName and StudentID. That is, StudentID determines CourseID and, due to the FD  $\text{CourseID} \rightarrow \text{CourseName}$ , then StudentID determines CourseName (via the non-prime attribute CourseID).

6. Consider the  $R(A, B, C, D)$ , assume that  $A$  is the Primary Key and assume the FDs:  $\{A \rightarrow B, A \rightarrow C, AB \rightarrow C, C \rightarrow D\}$ .

Which of the following would violate the 3NF rule?

- (a)  $AB \rightarrow C$
- (b)  $C \rightarrow D$**
- (c)  $A \rightarrow BCD$
- (d) None of the above

**Explanation:** In 3NF we have that “no non-prime attribute should depend on another non-prime attribute” (i.e, no transitive dependency). The non-prime attribute  $D$  is fully functionally dependent on another non-prime attribute  $C$ . Hence, this violates 3NF.

7. Consider the relation  $R(A, B, C)$  with  $\{A \rightarrow B, C \rightarrow B\}$ . Assume that we decompose  $R$  into  $R_1(A, B)$  and  $R_2(A, C)$ . Which of the following is true for this case?

- (a)  $R_1$  and  $R_2$  are in BCNF**
- (b) Dependency preserving decomposition
- (c)  $R_1$  and  $R_2$  are in 3NF**
- (d) All of the above

**Explanation:** If we have a relation with just two attributes, we cannot look for partial functional dependencies, transitive functional dependency, or multiple candidate keys. Hence, the relations  $R_1$  and  $R_2$  are in 3NF and BCNF. The decomposition given above is not a dependency preserving decomposition. Because the decomposition results in elimination of  $C \rightarrow B$ .

8. Propose a set of FDs for the relation  $R(A, B, C, D)$  with primary key  $\{AB\}$  such that  $R$  is in 1NF but not in 2NF.

**Solution:** Consider the set of FDs:  $AB \rightarrow CD$  and  $B \rightarrow C$ .  $\{AB\}$  is the PK for this relation since  $AB \rightarrow CD$  which also implies that  $AB \rightarrow ABCD$ . Moreover, the FD:  $B \rightarrow C$  violates 2NF since:

- $B$  is not a super key
- $C$  is not part of some candidate key of  $R$
- $B$  is a *subset* of the primary key  $\{AB\}$  (partial functional dependency)

9. Propose a set of FDs for the relation  $R(A,B,C,D)$  with primary key  $\{AB\}$  such that  $R$  is in 2NF but not in 3NF.

**Solution:** Consider the set of FDs:  $AB \rightarrow CD$  and  $C \rightarrow D$ .  $\{AB\}$  is obviously the primary key for this relation since  $AB \rightarrow CD$  implies also that  $AB \rightarrow ABCD$ . Moreover, the FD:  $C \rightarrow D$  violates 3NF but not 2NF since:

- $C$  is not a super key
- $D$  is not part of some key of  $R$
- $D$  is transitively dependent of the primary key  $\{AB\}$  via the non-prime attribute  $C$ .

10. Consider the relation  $R(A, B, C)$  with the FD:  $B \rightarrow C$ . If  $A$  is a candidate key for  $R$ , is it possible for  $R$  to be in BCNF? If so, under what conditions? If not, explain why not.

**Solution:** The only way  $R$  could be in BCNF is if  $B$  is a super key for  $R$ .
